TASK 1

a. Research and do a writeup on API pagination. What is it? Its importance

API Pagination:

It is an approach used to structurally retrieve data in a way that is convenient. Some API endpoints get data that is large, so managing and displaying such data becomes tedious. What API pagination does, is split up the data into pages or chunks.

Importance of API:

-API Pagination is quite efficient for handling errors. When errors such as timeouts of servers occur,network errors occur, the whole page is not reloaded; rather the pages that have been affected by the error are reloaded. This helps when dealing with a lot of data. It saves time and increases efficiency.

-Allows efficient growth of large datasets.

-API pagination responses are cached allowing them to be reused at a later stage. This improves performance as existing data that is cached can be used if needed instead of repeating the requests.
